```

2 Data Structure

2.1 Balanced tree

2.1.1 Link-cut tree

```
1 void access (int x) {
2   int u = x, v = -1;
3   while (u != -1) {
4     splay (u); push_down (u);
5     if (~n[u].c[1]) n[n[u].c[1]].f = -1, n[n[u].c[1]].p
      = u;
6     n[u].c[1] = v;
7     if (~v) n[v].f = u, n[v].p = -1;
8     update (u); u = n[v = u].p; }
9   splay (x); }
```

2.1.2 Splay operation

```
1 void access (int x) {
2   int u = x, v = -1;
3   while (u != -1) {
4     splay (u); push_down (u);
5     if (~n[u].c[1]) n[n[u].c[1]].f = -1, n[n[u].c[1]].p
      = u;
6     n[u].c[1] = v;
7     if (~v) n[v].f = u, n[v].p = -1;
8     update (u); u = n[v = u].p; }
9   splay (x); }
```

2.2 KD tree

Find the k -th closest/farthest point in $O(kn^{1-\frac{1}{k}})$.

Usage:

1. Store the data in p[].

2. Execute init.

3. Execute min_kth or max_kth for queries (k is 1-based).

Note: Switch to the commented code for Manhattan distance.

```
1 template <int MAXN = 200000, int MAXK = 2>
2 struct kd_tree {
3   int k, size;
4   struct point { int data[MAXK], id; } p[MAXN];
5   struct kd_node {

17     return std::vector<point> (ret.begin(), ret.begin
18         () + cnt - 1); }

```

3.4.2 Delaunay triangulation

In mathematics and computational geometry, a Delaunay triangulation (also known as a Delone triangulation) for a given set P of discrete points in a plane is a triangulation $DT(P)$ such that no point in P is inside the circumcircle of any triangle in $DT(P)$. Delaunay triangulations maximize the minimum angle of all the angles of the triangles in the triangulation; they tend to avoid sliver triangles.

The Delaunay triangulation of a discrete point set P in general position corresponds to the dual graph of the Voronoi diagram for P . Special cases include the existence of three points on a line and four points on circle.

Properties: Let n be the number of points.

1. The union of all triangles in the triangulation is the convex hull of the points.
2. The Delaunay triangulation contains $O(n)$ triangles.
3. If there are b vertices on the convex hull, then any triangulation of the points has at most $2n - 2 - b$ triangles, plus one exterior face.
4. If points are distributed according to a Poisson process in the plane with constant intensity, then each vertex has on average six surrounding triangles.
5. In the plane, the Delaunay triangulation maximizes the minimum angle. Compared to any other triangulation of the points, the smallest angle in the Delaunay triangulation is at least as large as the smallest angle in any other. However, the Delaunay triangulation does not necessarily minimize the maximum angle. The Delaunay triangulation also does not necessarily minimize the length of the edges.
6. A circle circumscribing any Delaunay triangle does not contain any other input points in its interior.
7. If a circle passing through two of the input points doesn't contain any other of them in its interior, then the segment connecting the two points is an edge of a Delaunay triangulation of the given points.
8. Each triangle of the Delaunay triangulation of a set of points in d -dimensional spaces corresponds to a facet of convex hull of the projection of the points onto a $(d + 1)$ -dimensional paraboloid, and vice versa.

9. The closest neighbor b to any point p is on an edge bp in the Delaunay triangulation since the nearest neighbor graph is a sub-graph of the Delaunay triangulation.
10. The Delaunay triangulation is a geometric spanner: the shortest path between two vertices, along Delaunay edges, is known to be no longer than $\frac{4\pi}{3\sqrt{3}} \approx 2.418$ times the Euclidean distance between them.
11. The Euclidean minimum spanning tree of a set of points is a subset of the Delaunay triangulation of the same points, and this can be exploited to compute it efficiently.

Usage:

1. Initialize the coordinate range with `trig::LOTS`.
2. `trig::find`: Find the triangle that contains the given point.
3. `trig::add_point`: Add the point to the triangulation.
4. One certain triangle is in the triangulation if `tri::has_child()` == 0.
5. To find the neighbouring triangles of u , check `u.e[i].tri`, with vertex of the corresponding edge `u.p[(i + 1) % 3]` and `u.p[(i + 2) % 3]`.

   line (b, c + (a - c).rot (sq3)));
12  else mid = line_intersect (line (a, c + (b - c).rot (
   sq3)), line (c, b + (a - b).rot (sq3)));
13  return mid; }

```

3.4.5 Triangle center

Trilinear coordinates:

1. incenter: $1:1:1$.
2. centroid: $bc:ca:ab$.
3. circumcenter: $\cos A:\cos B:\cos C$.
4. orthocenter: $\sec A:\sec B:\sec C$.
5. Non-trivial Fermat point: $\csc(A + \pi/3):\csc(B + \pi/3):\csc(C + \pi/3)$.

```

1 point incenter (cp a, cp b, cp c) {
2   double p = dis (a, b) + dis (b, c) + dis (c, a);
3   return (a * dis (b, c) + b * dis (c, a) + c * dis (a,
   b)) / p; }
4 point circumcenter (cp a, cp b, cp c) {
5   point p = b - a, q = c - a, s (dot (p, p) / 2, dot (q
   , q) / 2);
6   return a + point (det (s, point (p.y, q.y)), det (
   point (p.x, q.x), s)) / det (p, q); }
7 point orthocenter (cp a, cp b, cp c) { return a + b +
   c - circumcenter (a, b, c) * 2; }

```

4 Graph

```

1 template<int MAXN = 100000, int MAXM = 100000>
2 struct edge_list {
3   int size, begin[MAXN], dest[MAXM], next[MAXM];
4   void clear (int n) { size = 0; std::fill (begin,
   begin + n, -1); }
5   edge_list (int n = MAXN) { clear (n); }
6   void add_edge (int u, int v) { dest[size] = v; next[
   size] = begin[u]; begin[u] = size++; } };
7 template<int MAXN = 100000, int MAXM = 100000>
8 struct cost_edge_list {
9   int size, begin[MAXN], dest[MAXM], next[MAXM], cost[
   MAXM];
10  void clear (int n) { size = 0; std::fill (begin,
   begin + n, -1); }

   size++; } };

```

4.1 Characteristic

4.1.1 Euler characteristic

The Euler characteristic χ was classically defined for the surfaces of polyhedra, according to the formula

$$\chi = V - E + F$$

where V , E , and F are respectively the numbers of vertices (corners), edges and faces in the given polyhedron. Any convex polyhedron's surface has Euler characteristic

$$V - E + F = 2.$$

This equation is known as Euler's polyhedron formula. It corresponds to the Euler characteristic of the sphere (i.e. $\chi = 2$), and applies identically to spherical polyhedra.

The Euler characteristic of a closed orientable surface can be calculated from its genus g (the number of tori in a connected sum decomposition of the surface; intuitively, the number of "handles") as

$$\chi = 2 - 2g.$$

The Euler characteristic of a closed non-orientable surface can be calculated from its non-orientable genus k (the number of real projective planes in a connected sum decomposition of the surface) as

$$\chi = 2 - k.$$

Euler's formula also states that if a finite, connected, planar graph is drawn in the plane without any edge intersections, and v is the number of vertices, e is the number of edges and f is the number of faces (regions bounded by edges, including the outer, infinitely large region), then

$$v - e + f = 2.$$

In a finite, connected, simple, planar graph, any face (except possibly the outer one) is bounded by at least three edges and every edge touches at most two faces; using Euler's formula, one can then show that these graphs are sparse in the sense that if $v \geq 3$:

$$e \leq 3v - 6.$$

4.2 Clique

4.2.1 DN maximum clique

Find the maximum clique ($n \leq 150$).

Example:

```

1 BB e[N]; int ans, sol[N]; for (...) e[x][y] = e[y][x]
   = true;
2 max_clique mc (e, n); mc.mcqdyn (sol, ans); //0-based.
3 for (int i = 0; i < ans; ++i) std::cout << sol[i] <<
   std::endl;

```

```

1 typedef bool BB[N]; struct max_clique {
2   const BB *e; int pk, level; const float Tlimit;
3   struct vertex { int i, d; vertex (int i) : i(i), d(0)
   {} };
4   typedef std::vector<vertex> vertices; vertices V;
5   typedef std::vector<int> colors; colors QMAX, Q;
6   std::vector<colors> C;
7   static bool desc_degree (const vertex &vi, const vertex
   &vj) { return vi.d > vj.d; }
8   void init_colors (vertices &v) {
9     const int max_degree = v[0].d;
10    for (int i = 0; i < (int) v.size(); ++i) v[i].d = std
   ::min (i, max_degree) + 1; }
11   void set_degrees (vertices &v) {
12    for (int i = 0, j; i < (int) v.size(); ++i)
13      for (v[i].d = j = 0; j < (int) v.size(); ++j)
14        v[i].d += e[v[i].i][v[j].i]; }
15   struct steps { int i1, i2; steps () : i1 (0), i2 (0) {}
   };
16   std::vector<steps> S;

55 void degree_sort (vertices & R) {
56     set_degrees (R); std::sort (R.begin (), R.end (),
57         desc_degree); }
58 max_clique (const BB *conn, const int sz, const float
59     tt = .025) : pk (0), level (1), Tlimit (tt) {
60     for (int i = 0; i < sz; ++i) V.push_back (vertex (i));
61     e = conn, C.resize (sz + 1), S.resize (sz + 1); } };
62 BB e[N]; int ans, sol[N]; for (...) e[x][y] = e[y][x]
63     = true;
64 max_clique mc (e, n); mc.mcqdyn (sol, ans); //0-based.
65 for (int i = 0; i < ans; ++i) std::cout << sol[i] <<
66     std::endl;

```

4.3 Cut

4.3.1 2-SAT

In terms of the implication graph, two literals belong to the same strongly connected component whenever there exist chains of implications from one literal to the other and vice versa. Therefore, the two literals must have the same value in any satisfying assignment to the given 2-satisfiability instance. In particular, if a variable and its negation both belong to the same strongly connected component, the instance cannot be satisfied, because it is impossible to assign both of these literals the same value. As Aspvall et al. showed, this is a necessary and sufficient condition: a 2-CNF formula is satisfiable if and only if there is no variable that belongs to the same strongly connected component as its negation.

This immediately leads to a linear time algorithm for testing satisfiability of 2-CNF formulae: simply perform a strong connectivity analysis on the implication graph and check that each variable and its negation belong to different components. However, as Aspvall et al. also showed, it also leads to a linear time algorithm for finding a satisfying assignment, when one exists. Their algorithm performs the following steps:

Construct the implication graph of the instance, and find its strongly connected components using any of the known linear-time algorithms for strong connectivity analysis.

Check whether any strongly connected component contains both a variable and its negation. If so, report that the instance is not satisfiable and halt.

Construct the condensation of the implication graph, a smaller graph that has one vertex for each strongly connected component, and an edge from component i to component j whenever the implication graph contains an edge uv such that u belongs to component i and v belongs to component j . The condensation is automatically a directed acyclic graph and, like the implication graph from which it was formed, it is skew-symmetric.

Topologically order the vertices of the condensation. In practice this may be efficiently achieved as a side effect of the previous step, as components are generated by Kosaraju's algorithm in topological order and by Tarjan's algorithm in reverse topological order.

For each component in the reverse topological order, if its variables do not already have truth assignments, set all the literals in the component to be true. This also causes all of the literals in the complementary component to be set to false.

4.3.2 Dominator tree

Find the immediate dominator ($\text{idom}[]$) of each node, $\text{idom}[x]$ will be x if x does not have a dominator, and will be -1 if x is not reachable from s .

```

1 template <int MAXN = 100000, int MAXM = 100000>
2 struct dominator_tree {
3     int dfn[MAXN], sdom[MAXN], idom[MAXN], id[MAXN], f[
4         MAXN], fa[MAXN], smin[MAXN], stamp;
5     void predfs (int x, const edge_list <MAXN, MAXM> &
6         succ) {
7         id[dfn[x] = stamp++] = x;
8         for (int i = succ.begin[x]; ~i; i = succ.next[i]) {
9             int y = succ.dest[i];
10            if (dfn[y] < 0) { f[y] = x; predfs (y, succ); } } }
11 int getfa (int x) {
12     if (fa[x] == x) return x;
13     int ret = getfa (fa[x]);
14     if (dfn[sdom[smin[fa[x]]]] < dfn[sdom[smin[x]]])
15         smin[x] = smin[fa[x]];
16     return fa[x] = ret; }
17 void solve (int s, int n, const edge_list <MAXN, MAXM>
18     & succ) {
19     std::fill (dfn, dfn + n, -1); std::fill (idom, idom
20         + n, -1);
21     static edge_list <MAXN, MAXM> pred, tmp; pred.clear
22         (n);
23     for (int i = 0; i < n; ++i) for (int j = succ.begin[
24         i]; ~j; j = succ.next[j])
25         pred.add_edge (succ.dest[j], i);
26     stamp = 0; tmp.clear (n); predfs (s, succ);
27     for (int i = 0; i < stamp; ++i) fa[id[i]] = smin[id[
28         i]] = id[i];
29     for (int o = stamp - 1; o >= 0; --o) {
30         int x = id[o];
31         if (o) {

```

```

24     sdom[x] = f[x];
25     for (int i = pred.begin[x]; ~i; i = pred.next[i])
26     {
27         int p = pred.dest[i];
28         if (dfn[p] < 0) continue;
29         if (dfn[p] > dfn[x]) { getfa (p); p = sdom[smin[p]
30             ]; }
31         if (dfn[sdom[x]] > dfn[p]) sdom[x] = p; }
32     tmp.add_edge (sdom[x], x); }
33 while (~tmp.begin[x]) {
34     int y = tmp.dest[tmp.begin[x]];
35     tmp.begin[x] = tmp.next[tmp.begin[x]]; getfa (y);

4.5 Matching

Tutte-Berge formula The theorem states that the size of a maximum matching of a graph $G = (V, E)$ equals

$$\frac{1}{2} \min_{U \subseteq V} (|U| - \text{odd}(G - U) + |V|),$$

where $\text{odd}(H)$ counts how many of the connected components of the graph H have an odd number of vertices.

Tutte theorem A graph, $G = (V, E)$, has a perfect matching if and only if for every subset U of V , the subgraph induced by $V - U$ has at most $|U|$ connected components with an odd number of vertices.

Hall's marriage theorem A family S of finite sets has a transversal if and only if S satisfies the marriage condition.

4.5.1 Blossom algorithm

Maximum matching for general graphs.

```

1  template <int MAXN = 500, int MAXM = 250000>

```

4.5.2 Blossom algorithm (weighted)

Maximum matching for general weighted graphs in $O(n^3)$ (1-based).

Usage:

1. Set n to the size of the vertices.
2. Execute init.
3. Set $g[i][j].w$ to the weight of the edges.
4. Execute solve.
5. The first result is the answer, the second one is the number of matching pairs. Obtain the exact matching with `match[i]`.

```

1 struct weighted_blossom {
2   static const int INF = INT_MAX, MAXN = 400;
3   struct edge { int u, v, w; edge (int u = 0, int v = 0,
4     int w = 0): u(u), v(v), w(w) {} };

30        return sum; } }

```

4.6 Tree

4.7 Prufer sequence

In combinatorial mathematics, the Prufer sequence of a labeled tree is a unique sequence associated with the tree. The sequence for a tree on n vertices has length $n - 2$.

One can generate a labeled tree's Prufer sequence by iteratively removing vertices from the tree until only two vertices remain. Specifically, consider a labeled tree T with vertices $1, 2, \dots, n$. At step i , remove the leaf with the smallest label and set the i th element of the Prufer sequence to be the label of this leaf's neighbour.

One can generate a labeled tree from a sequence in three steps. The tree will have $n + 2$ nodes, numbered from 1 to $n + 2$. For each node set its degree to the number of times it appears in the sequence plus 1. Next, for each number in the sequence $a[i]$, find the first (lowest-numbered) node, j , with degree equal to 1, add the edge $(j, a[i])$ to the tree, and decrement the degrees of j and $a[i]$. At the end of this loop two nodes with degree 1 will remain (call them u, v). Lastly, add the edge (u, v) to the tree.

The Prufer sequence of a labeled tree on n vertices is a unique sequence of length $n - 2$ on the labels 1 to n - this much is clear. Somewhat less obvious is the fact that for a given sequence S of length $n - 2$ on the labels 1 to n , there is a unique labeled tree whose Prufer sequence is S .

4.8 Spanning tree counting

Kirchhoff's Theorem: the number of spanning trees in a graph G is equal to *any* cofactor of the Laplacian matrix of G , which is equal to the difference between the graph's degree matrix (a diagonal matrix with vertex degrees on the diagonals) and its adjacency matrix (a $(0,1)$ -matrix with 1's at places corresponding to entries where the vertices are adjacent and 0's otherwise).

The number of edges with a certain weight in a minimum spanning tree is fixed given a graph. Moreover, the number of its arrangements can be obtained by finding a minimum spanning tree, compressing connected components of other edges in that tree into a point, and then applying Kirchhoff's theorem with only edges of the certain weight in the graph. Therefore, the number of minimum spanning trees in a graph can be solved by multiplying all numbers of arrangements of edges of different weights together.

5 Mathematics

5.1 Computation

5.1.1 Adaptive Simpson's method

Compute $\int_l^r f(x)dx$ with error less than ϵ .

```

1 struct simpson {
2     double area (double (*f) (double), double l, double r
3         ) {
4         double m = 1 + (r - l) / 2;
5         return (f (l) + 4 * f (m) + f (r)) * (r - l) / 6; }
6     double solve (double (*f) (double), double l, double
7         r, double eps, double a) {
8         double m = 1 + (r - l) / 2;
9         double left = area (f, l, m), right = area (f, m, r)
10            ;
11         if (fabs (left + right - a) <= 15 * eps) return left
12             + right + (left + right - a) / 15.0;
13         return solve (f, l, m, eps / 2, left) + solve (f, m,
14             r, eps / 2, right); }
15     double solve (double (*f) (double), double l, double
16         r, double eps) {
17         return solve (f, l, r, eps, area (f, l, r)); } }

```

5.1.2 Euclidean-like algorithm

Compute $\sum_{i=0}^{n-1} [\frac{a+bi}{m}]$.

```

1 long long solve (long long n, long long a, long long b,
2     long long m) {
3     if (b == 0) return n * (a / m);
4     if (a >= m) return n * (a / m) + solve (n, a % m, b,
5         m);
6     if (b >= m) return (n - 1) * n / 2 * (b / m) + solve
7         (n, a, b % m, m);
8     return solve ((a + b * n) / m, (a + b * n) % m, m, b)
9         ; }

```

5.1.3 Extended Eratosthenes sieve

Compute the prefix sum of multiplicative functions.

Usage:

1. Modify pre_pow to compute the sum of powers.
2. Modify pfunc to compute $f(p)$ with a prime p .
3. Modify cfunc to compute $f(px)$ with $f(x) = k$ and $p|x$.
4. Modify assemble to store $f(x_i)$ in funca[i] with x_i^k equal to powa[k][i] and funcb[i] with x_i^k equal to powb[k][i].
5. Execute solve and profit.

```

1 template <int SN = 110000, int D = 2>
2 struct ees {
3     int co[SN], prime[SN], psize, sn;
4     long long powa[D + 1][SN], powb[D + 1][SN];
5     long long funca[SN], funcb[SN];
6     long long pow (long long x, int n) {
7         long long res = 1;
8         for (int i = 0; i < n; ++i) res *= x;
9         return res; }
10    long long pre_pow (long long x, int n) {
11        if (n == 0) return x;
12        if (n == 1) return (1 + x) * x / 2;
13        if (n == 2) return (1 + 2 * x) * (1 + x) * x / 6;

```

```

14 return 0; }

42     for (; x < psize && mul * prime[x] * prime[x] <= n;
++x) {
43         long long nmul = mul * prime[x], nval = val * pfunc
(prime[x]);
44         for (; nmul <= n; nmul *= prime[x], nval = cfunc (
nval, prime[x]))
45             dfs (x + 1, prime[x], nmul, nval, n, res); }
46     if (n / mul > 1) res += val * ((n / mul <= sn ?
funca[n / mul] : funcb[mul]) - funca[f]);
47     if (f > 1 && mul % (f * f) == 0) res += val; }
48 long long solve (long long n) {
49     if (n == 0) return 0;
50     long long res = 1;
51     init (n); dfs (0, 1, 1, 1, n, res);
52     return res; } };

```

5.1.4 Fast power module

Compute $x^n \bmod mod$.

```

1 int fpm (int x, int n, int mod) {
2     int ans = 1, mul = x; while (n) {
3         if (n & 1) ans = int (1ll * ans * mul % mod);
4         mul = int (1ll * mul * mul % mod); n >>= 1; }
5     return ans; }
6 long long mul_mod (long long x, long long y, long long
mod) {
7     long long t = (x * y - (long long) ((long double) x /
mod * y + 1E-3) % mod) % mod;
8     return t < 0 ? t + mod : t; }
9 long long llfpm (long long x, long long n, long long
mod) {
10    long long ans = 1, mul = x; while (n) {
11        if (n & 1) ans = mul_mod (ans, mul, mod);
12        mul = mul_mod (mul, mul, mod); n >>= 1; }
13    return ans; }

```

5.1.5 Lucas's theorem

For non-negative integers m and n and a prime p , the following congruence relation holds:

$$\binom{m}{n} \equiv \prod_{i=0}^k \binom{m_i}{n_i} \pmod{p},$$

where

$$m = m_k p^k + m_{k-1} p^{k-1} + \cdots + m_1 p + m_0,$$

and

$$n = n_k p^k + n_{k-1} p^{k-1} + \cdots + n_1 p + n_0$$

are the base p expansions of m and n respectively. This uses the convention that $\binom{m}{n} = 0$ if $m < n$.

5.1.6 Mobius inversion

Mobius inversion formula

$$[x = 1] = \sum_{d|x} \mu(d)$$

Gcd inversion

$$\begin{aligned} \sum_{a=1}^n \sum_{b=1}^n \gcd^2(a, b) &= \sum_{d=1}^n d^2 \sum_{i=1}^{\lfloor \frac{n}{d} \rfloor} \sum_{j=1}^{\lfloor \frac{n}{d} \rfloor} [\gcd(i, j) = 1] \\ &= \sum_{d=1}^n d^2 \sum_{i=1}^{\lfloor \frac{n}{d} \rfloor} \sum_{j=1}^{\lfloor \frac{n}{d} \rfloor} \sum_{t|\gcd(i, j)} \mu(t) \\ &= \sum_{d=1}^n d^2 \sum_{t=1}^{\lfloor \frac{n}{d} \rfloor} \mu(t) \sum_{i=1}^{\lfloor \frac{n}{d} \rfloor} [t|i] \sum_{j=1}^{\lfloor \frac{n}{d} \rfloor} [t|j] \\ &= \sum_{d=1}^n d^2 \sum_{t=1}^{\lfloor \frac{n}{d} \rfloor} \mu(t) \left\lfloor \frac{n}{dt} \right\rfloor^2 \end{aligned}$$

The formula can be computed in $O(n \log n)$ complexity. Moreover, let $l = dt$, then

$$\sum_{d=1}^n d^2 \sum_{t=1}^{\lfloor \frac{n}{d} \rfloor} \mu(t) \left\lfloor \frac{n}{dt} \right\rfloor^2 = \sum_{l=1}^n \left\lfloor \frac{n}{l} \right\rfloor^2 \sum_{d|l} d^2 \mu\left(\frac{l}{d}\right)$$

Let $f(l) = \sum_{d|l} d^2 \mu\left(\frac{l}{d}\right)$. It can be proven that $f(l)$ is multiplicative. Besides, $f(p^k) = p^{2k} - p^{2k-2}$.

Therefore, with linear sieve the formula can be computed in $O(n)$ complexity.

5.1.7 Zeller's congruence

Convert between a calendar date and its Gregorian calendar day ($y \geq 1$) (0 = Monday, 1 = Tuesday, ..., 6 = Sunday).

```

1 int get_id (int y, int m, int d) {
2     if (m < 3) { --y; m += 12; }
3     return 365 * y + y / 4 - y / 100 + y / 400 + (153 * (
m - 3) + 2) / 5 + d - 307; }
4 std::tuple<int, int, int> date (int id) {
5     int x = id + 1789995, n, i, j, y, m, d;
6     n = 4 * x / 146097; x -= (146097 * n + 3) / 4;
7     i = (4000 * (x + 1)) / 1461001; x -= 1461 * i / 4 -
31;
8     j = 80 * x / 2447; d = x - 2447 * j / 80;
9     x = j / 11;
10    m = j + 2 - 12 * x; y = 100 * (n - 49) + i + x;
11    return std::make_tuple (y, m, d); }

```

5.2 Dynamic programming

Divide & conquer optimization

$$f(i) = \min_{k < i} \{b(k) + c[k][i]\}$$

$k(i) \leq k(i+1)$ holds true if $c[a][c] + c[b][d] < c[a][d] + c[b][c]$.

Knuth optimization

$$f(i, j) = \min_{i < k < j} \{f(i, k) + f(k, j)\} + c[i][j]$$

$k(i, j-1) \leq k(i, j) \leq k(i+1, j)$ holds true if $c[a][c] + c[b][d] < c[a][d] + c[b][c]$.

5.3 Equality and inequality

5.3.1 Baby step giant step algorithm

Solve $a^x = b \bmod c$ in $O(\sqrt{c})$.

```

1 struct bsqs {
2     int solve (int a, int b, int c) {
3         std::unordered_map<int, int> bs;
4         int m = (int) sqrt ((double) c) + 1, res = 1;
5         for (int i = 0; i < m; ++i) {
6             if (bs.find (res) == bs.end ()) bs[res] = i;
7             res = int (1LL * res * a % c); }
8         int mul = 1, inv = (int) inverse (a, c);
9         for (int i = 0; i < m; ++i) mul = int (1LL * mul *
inv % c);
10        res = b % c;
11        for (int i = 0; i < m; ++i) {
12            if (bs.find (res) != bs.end ()) return i * m + bs[
res];
13            res = int (1LL * res * mul % c); }
14        return -1; } };

```

5.3.2 Chinese remainder theorem

Find positive integers $x = out_{first} + k \cdot out_{second}$ that satisfies $x \equiv in_{i,first} \bmod in_{i,second}$.

```

1 struct crt {
2     long long fix (const long long &a, const long long &b
) { return (a % b + b) % b; }
3     bool solve (const std::vector<std::pair<long long,
long long>> &in, std::pair<long long, long long>
&out) {
4         out = std::make_pair (1LL, 1LL);
5         for (int i = 0; i < (int) in.size (); ++i) {
6             long long n, u;
7             euclid (out.second, in[i].second, n, u);
8             long long divisor = std::__gcd (out.second, in[i].
second);

```

```

9   if ((in[i].first - out.first) % divisor) return
    false;
10  n *= (in[i].first - out.first) / divisor;
11  n = fix (n, in[i].second);
12  out.first += out.second * n;
13  out.second *= in[i].second / divisor;
14  out.first = fix (out.first, out.second); }
15  return true; } };
```

5.3.3 Extended Euclidean algorithm

Solve $ax + by = \gcd(a, b)$.

```

1 void euclid (const long long &a, const long long &b,
2             long long &x, long long &y) {
3     if (b == 0) x = 1, y = 0;
4     else euclid (b, a % b, y, x), y -= a / b * x; }
5 long long inverse (long long x, long long m) {
6     long long a, b; euclid (x, m, a, b); return (a % m +
7     m) % m; }
```

5.3.4 Pell equation

Find the smallest integer root of $x^2 - ny^2 = 1$ when n is not a square number, with the solution set $x_{k+1} = x_0x_k + ny_0y_k, y_{k+1} = x_0y_k + y_0x_k$.

```

1 template <int MAXN = 100000>
2 struct pell {
3     std::pair <long long, long long> solve (long long n)
4     {
5         static long long p[MAXN], q[MAXN], g[MAXN], h[MAXN],
6             a[MAXN];
7         p[1] = q[0] = h[1] = 1; p[0] = q[1] = g[1] = 0;
8         a[2] = (long long) (floor (sqrt1 (n) + 1e-7L));
9         for (int i = 2; ; ++i) {
10             g[i] = -g[i-1] + a[i] * h[i-1];
11             h[i] = (n - g[i] * g[i]) / h[i-1];
12             a[i+1] = (g[i] + a[2]) / h[i];
13             p[i] = a[i] * p[i-1] + p[i-2];
14             q[i] = a[i] * q[i-1] + q[i-2];
15             if (p[i] * p[i] - n * q[i] * q[i] == 1)
16                 return { p[i], q[i] }; } }
```

5.3.5 Quadric residue

Solve $x^2 \equiv n \pmod{p}$ ($0 \leq a < p$) where p is prime in $O(\log p)$.

```

1 struct quadric {
2     void multiply (long long &c, long long &d, long long a
3     , long long b, long long w, long long p) {
4         int cc = (a * c + b * d % p * w) % p;
5         int dd = (a * d + b * c) % p; c = cc, d = dd; }
6     bool solve (int n, int p, int &x) {
7         if (n == 0) return x = 0, true; if (p == 2) return x
8         = 1, true;
9         if (power (n, p / 2, p) == p - 1) return false;
10        long long c = 1, d = 0, b = 1, a, w;
11        do { a = rand() % p; w = (a * a - n + p) % p;
12            if (w == 0) return x = a, true;
13        } while (power (w, p / 2, p) != p - 1);
14        for (int times = (p + 1) / 2; times; times >= 1) {
15            if (times & 1) multiply (c, d, a, b, w, p);
16            multiply (a, b, a, b, w, p); }
17        return x = c, true; }
```

5.3.6 Simplex

Maximize $\sum c_j x_j$ ($0 \leq j < n$) with constraints $\sum a_{ij} x_j \leq b_i$ ($0 \leq i < m, 0 \leq j < n$). Collect the solution in $\text{an}[]$.

Note: maximizing $\mathbf{c}^T \mathbf{x}$ subject to $\mathbf{Ax} \leq \mathbf{b}, \mathbf{x} \geq \mathbf{0}$ is equivalent to minimizing $\mathbf{b}^T \mathbf{y}$ subject to $\mathbf{A}^T \mathbf{x} \geq \mathbf{c}, \mathbf{y} \geq \mathbf{0}$.

```

1 template <int MAXN = 100, int MAXM = 100>
2 struct simplex {
3     int n, m; double a[MAXN][MAXN], b[MAXN], c[MAXN];
4     bool infeasible, unbounded;
5     double v, an[MAXN + MAXM]; int q[MAXN + MAXM];
6     void pivot (int l, int e) {
7         std::swap (q[e], q[l + n]);
8         double t = a[l][e]; a[l][e] = 1; b[l] /= t;
9         for (int i = 0; i < n; ++i) a[l][i] /= t;
10        for (int i = 0; i < m; ++i) if (i != l && std::abs (
11            a[i][e]) > EPS) {

36         if (!~l) return unbounded = true, 0; }
37     for (int i = n; i < n + m; ++i) if (~q[i]) an[q[i]]
38         = b[i - n];
39     return v; } }
```

5.4 Game theory

Ferguson game There are two boxes with m stones and n stones. Each player can empty any one box and move any positive number of stones from another box to this box each step. The player who cannot do so loses.

Solution: The first player loses if and only if both m and n are odd.

Anti-Nim game Nim game where the player who takes the last stone loses.

Solution: The first player wins when:

1. Each pile contains only one stone, and there are even number of piles, or;
2. There exists at least one pile with more than one stone, and the nim-value of the game is not zero.

Fibonacci game Two players take turns to collect stones from one pile with n stones. The first player may take any positive number of stones during the first move, but not all of them. After that, each player may take any positive number of stones, but less than twice the number of stones taken during the last turn. The player who takes the last stone wins.

Solution: The first player wins if and only if n is not a fibonacci number.

Wythoff's game The game is played with two piles of counters. Players take turns removing counters from one or both piles; when removing counters from both piles, the numbers of counters removed from each pile must be equal. The game ends when one person removes the last counter or counters, thus winning.

Solution: The second player wins if and only if $\lfloor \frac{\sqrt{5}+1}{2} |A-B| \rfloor = \min(A, B)$

5.4.1 Joseph cycle

n players are numbered with $0, 1, 2, \dots, n-1$. $f_{1,m} = 0, f_{n,m} = (f_{n-1,m} + m) \bmod n$.

5.5 Machine learning

5.5.1 Neural network

Train with ft features, n layers and m neurons per layer.

```

1 template <int ft = 3, int n = 2, int m = 3, int
2     MAXDATA = 100000>
3 struct network {
4     double wp[n][m][ft/* or m, if larger */], bp[n][m], w
5     [m], b, val[n][m], del[n][m], avg[ft + 1], sig[ft
6     + 1];
7     network () {
8         std::mt19937_64 mt (time (0));

```

6 String

6.1 Decomposition

6.1.1 Lyndon word

A k -ary Lyndon word of length $n > 0$ is an n -character string over an alphabet of size k , and which is the unique minimum element in the lexicographical ordering of all its rotations. Being the singularly smallest rotation implies that a Lyndon word differs from any of its non-trivial rotations, and is therefore aperiodic.

Alternately, a Lyndon word has the property that it is nonempty and, whenever it is split into two nonempty substrings, the left substring is always lexicographically less than the right substring. That is, if w is a Lyndon word, and $w = uv$ is any factorization into two substrings, with u and v understood to be non-empty, then $u < v$. This definition implies that a string w of length ≥ 2 is a Lyndon word if and only if there exist Lyndon words u and v such that $u < v$ and $w = uv$. Although there may be more than one choice of u and v with this property, there is a particular choice, called the standard factorization, in which v is as long as possible.

Lyndon words correspond to aperiodic necklace class representatives and can thus be counted with Moreau's necklace-counting function.

Duval provides an efficient algorithm for listing the Lyndon words of length at most n with a given alphabet size s in lexicographic order. If w is one of the words in the sequence, then the next word after w can be found by the following steps:

- Repeat the symbols from w to form a new word x of length exactly n , where the i th symbol of x is the same as the symbol at position $(i \bmod \text{length}(w))$ of w .

- As long as the final symbol of x is the last symbol in the sorted ordering of the alphabet, remove it, producing a shorter word.
- Replace the final remaining symbol of x by its successor in the sorted ordering of the alphabet.

The sequence of all Lyndon words of length at most n can be generated in time proportional to the length of the sequence.

According to the Chen-Fox-Lyndon theorem, every string may be formed in a unique way by concatenating a sequence of Lyndon words, in such a way that the words in the sequence are nonincreasing lexicographically. The final Lyndon word in this sequence is the lexicographically smallest suffix of the given string. A factorization into a nonincreasing sequence of Lyndon words (the so-called Lyndon factorization) can be constructed in linear time.

Given a string S of length N , one should proceed with the following steps:

- Let m be the index of the symbol-candidate to be appended to the already collected symbols. Initially, $m = 1$ (indices of symbols in a string start from zero).
- Let k be the index of the symbol we would compare others to. Initially, $k = 0$.
- While k and m are less than N , compare $S[k]$ (the k -th symbol of the string S) to $S[m]$. There are three possible outcomes:
 - $S[k]$ is equal to $S[m]$: append $S[m]$ to the current collected symbols. Increment k and m .
 - $S[k]$ is less than $S[m]$: if we append $S[m]$ to the current collected symbols, we'll get a Lyndon word. But we can't add it to the result list yet because it may be just a part of a larger Lyndon word. Thus, just increment m and set k to 0 so the next symbol would be compared to the first one in the string.
 - $S[k]$ is greater than $S[m]$: if we append $S[m]$ to the current collected symbols, it will be neither a Lyndon word nor a possible beginning of one. Thus, add the first $m - k$ collected symbols to the result list, remove them from the string, set m to 1 and k to 0 so that they point to the second and the first symbol of the string respectively.
- When $m > N$, it is essentially the same as encountering minus infinity, thus, add the first $m - k$ collected symbols to the result list after removing them from the string, set m to 1 and k to 0, and return to the previous step.
- Add S to the result list.

If one concatenates together, in lexicographic order, all the Lyndon words that have length dividing a given number n , the result is a de Bruijn sequence, a circular sequence of symbols such that each possible length- n sequence appears exactly once as one of its contiguous subsequences.

6.2 Matching

6.2.1 Minimal string rotation

Return the start index.

```
1 int min_rep (char *s, int l) {
2   int i, j, k;
3   i = 0; j = 1; k = 0;
4   while (i < l && j < l) {
5     k = 0; while (s[i + k] == s[j + k] && k < l) ++k;
6     if (k == l) return i;
7     if (s[i + k] > s[j + k])
8       if (i + k + 1 > j) i = i + k + 1;
9     else i = j + 1;
10    else if (j + k + 1 > i) j = j + k + 1;
11    else j = i + 1;
12  }
13  if (i < l) return i; else return j; }
```

6.3 Palindrome

6.3.1 Manacher

Odd palindromes only.

```
1 for (int i = 1, j = 0; i != (n << 1) - 1; ++i) {
2   int p = i >> 1, q = i - p, r = ((j + 1) >> 1) + 1[j]
3   - 1;
4   l[i] = r < q ? 0 : std::min (r - q + 1, 1[(j << 1) -
5   i]);
6   while (p - 1[i] != -1 && q + 1[i] != n
7   && s[p - 1[i]] == s[q + 1[i]]) l[i]++;
8   if (q + 1[i] - 1 > r) j = i;
9   a += 1[i]; }
```

6.3.2 Palindromic tree

Usage:

- extend: Return whether the tree has generated a new node.
- odd, even: Root of two trees.
- last: The node representing the last char.
- node::len: The length of the palindromic string of the node.

```
1 template <int MAXN = 1000000, int MAXC = 26>
2 struct palindromic_tree {
3   struct node {
4     node *child[MAXC], *fail; int len;
5     node (int len) : fail (NULL), len (len) {
6       memset (child, NULL, sizeof (child)); }
7   } node_pool[MAXN * 2], *tot_node;
8   int size, text[MAXN];
9   node *odd, *even, *last;
10  node *match (node *now) {
11    for (; text[size - now -> len - 1] != text[size];
12      now = now -> fail);
13    return now; }
14  bool extend (int token) {
15    text[++size] = token; node *now = match (last);
16    if (now -> child[token])
```

```
16    return last = now -> child[token], false;
17    last = now -> child[token] = new (tot_node++) node (
18      now -> len + 2);
19    if (now == odd) last -> fail = even;
20    else {
21      now = match (now -> fail);
22      last -> fail = now -> child[token]; }
23    return true; }
24  void init () {
25    text[size = 0] = -1; tot_node = node_pool;
26    last = even = new (tot_node++) node (0); odd = new (
27      tot_node++) node (-1);
28    even -> fail = odd; }
29  palindromic_tree () { init (); } };
```

6.4 Suffix

6.4.1 Suffix array

Usage:

- sa[i]: The beginning position of the i -th smallest suffix.
- rk[i]: The rank of the suffix beginning at position i .
- height[i]: The longest common prefix of sa[i] and sa[i - 1].

```
1 template <int MAXN = 1000000, int MAXC = 26>
2 struct suffix_array {
3   int rk[MAXN], height[MAXN], sa[MAXN];
4   int cmp (int *x, int a, int b, int d) {
5     return x[a] == x[b] && x[a + d] == x[b + d]; }
6   void doubling (int *a, int n) {
7     static int sRank[MAXN], tmpA[MAXN], tmpB[MAXN];
8     int m = MAXC, *x = tmpA, *y = tmpB;
9     for (int i = 0; i < m; ++i) sRank[i] = 0;
10    for (int i = 0; i < n; ++i) ++sRank[x[i] = a[i]];
11    for (int i = 1; i < m; ++i) sRank[i] += sRank[i -
12    1];
13    for (int i = n - 1; i >= 0; --i) sa[--sRank[x[i]]] =
14    i;
15    for (int d = 1, p = 0; p < n; m = p, d <= 1) {
16      p = 0; for (int i = n - d; i < n; ++i) y[p++] = i;
17      for (int i = 0; i < n; ++i) if (sa[i] >= d) y[p++]
18      = sa[i] - d;
19      for (int i = 0; i < m; ++i) sRank[i] = 0;
20      for (int i = 0; i < n; ++i) ++sRank[x[i]];
21      for (int i = 1; i < m; ++i) sRank[i] += sRank[i -
22      1];
23      for (int i = n - 1; i >= 0; --i) sa[--sRank[x[y[i]
24      l]]] = y[i];
25      std::swap (x, y); x[sa[0]] = 0; p = 1; y[n] = -1;
26      for (int i = 1; i < n; ++i)
27        x[sa[i]] = cmp (y, sa[i], sa[i - 1], d) ? p - 1 :
28        p++; } }
29  void solve (int *a, int n) {
30    a[n] = -1; doubling (a, n);
31    for (int i = 0; i < n; ++i) rk[sa[i]] = i;
32    int cur = 0;
33    for (int i = 0; i < n; ++i)
34      if (rk[i]) {
35        if (cur) cur--;
36        for (; a[i + cur] == a[sa[rk[i] - 1] + cur]; ++cur)
37          ;
38        height[rk[i]] = cur; } } };
```

6.4.2 Suffix automaton

Usage:

- head: The first state.
- tail: The last state. Terminating states can be reached via visiting the ancestors of tail.
- state::len: The longest length of the string in the state.
- state::right - 1: The first location in the string where the state can be reached.
- state::parent: the parent link.
- state::dest: the automaton link.

```
1 template <int MAXN = 1000000, int MAXC = 26>
2 struct suffix_automaton {
3   struct state {
4     int len, right; state *parent, *dest[MAXC];
5     state (int len = 0, int right = 0) : len (len),
6       right (right), parent (NULL) {
7       memset (dest, 0, sizeof (dest)); }
8   } state_pool[MAXN * 2], *tot_node, *null = new state()
9   ;
10  state *head, *tail;
11  void extend (int token) {
12    state *p = tail;
13    state *np = tail -> dest[token] ? null : new (
14      tot_node++) state (tail -> len + 1, tail -> len
15      + 1);
16    while (p && !p -> dest[token]) p -> dest[token] = np
17    , p = p -> parent;
18    if (!p) np -> parent = head;
19    else {
20      state *q = p -> dest[token];
21      if (p -> len + 1 == q -> len) {
22        np -> parent = q;
23      } else {
24        state *nq = new (tot_node++) state (*q);
25        nq -> len = p -> len + 1;
26        np -> parent = q -> parent = nq;
27        while (p && p -> dest[token] == q) {
28          p -> dest[token] = nq, p = p -> parent;
29        } } } }
```

```

25 tail = np == null ? np -> parent : np; }
26 void init () {
27     tot_node = node_pool;
28     head = tail = new (tot_node++) state (); }
29 suffix_automaton () { init (); } };
```

7 System

7.1 Builtin functions

1. `__builtin_clz`: Returns the number of leading 0-bits in `x`, starting at the most significant bit position. If `x` is 0, the result is undefined.
2. `__builtin_ctz`: Returns the number of trailing 0-bits in `x`, starting at the least significant bit position. If `x` is 0, the result is undefined.
3. `__builtin_clzsb`: Returns the number of leading redundant sign bits in `x`, i.e. the number of bits following the most significant bit that are identical to it. There are no special cases for 0 or other values.
4. `__builtin_popcount`: Returns the number of 1-bits in `x`.
5. `__builtin_parity`: Returns the parity of `x`, i.e. the number of 1-bits in `x` modulo 2.
6. `__builtin_bswap16`, `__builtin_bswap32`, `__builtin_bswap64`: Returns `x` with the order of the bytes (8 bits as a group) reversed.
7. `bitset::Find_first()`, `bitset::Find_next(idx)`: `bitset` builtin functions.

7.2 Fast IO

```

1 #define __attribute__ ((optimize ("O3")))
2 #define __inline__ __attribute__ ((__gnu_inline__,
3     __always_inline__, __artificial__))
4 namespace io {
5     const int SIZE = 1000000; static char buf[SIZE + 1],
6         *p = buf + SIZE;
7     template <class t> _bool read_int (t &x) {
8         register int f = 0, sgn = 0; x = 0;
9         while ((*p || (p = buf, buf[fread (buf, 1, SIZE,
10             stdin)] = 0, buf[0])) &&
11             (isdigit (*p) && (x = x * 10 + (*p - '0'), f = 1)
12             || !f && (*p != '-' || (sgn = 1)))) ++p;
13         if (sgn) x = -x;
14         return f; }
15     _int read_str (char *x, int len, char d = '\n') {
16         register int cnt = 0;
17         while ((*p || (p = buf, buf[fread (buf, 1, SIZE,
18             stdin)] = 0, buf[0])) &&
19             cnt < len && *p != d) *(x++) = *(p++), ++cnt;
20         if (*p == d) ++p;
21         return cnt; }
22     //Set f to true to force an output (typically at the
23     //last write command).
24     const int WSIZE = 1000000; static char wbuf[2 * WSIZE],
25         *q = wbuf;
26     _void write (bool f, const char *str, ...) {
27         va_list args; va_start (args, str);
28         if ((q += vsprintf (q, str, args)) - wbuf >= WSIZE
29             || f) fwrite (wbuf, 1, q - wbuf, stdout), q =
30             wbuf;
31         va_end (args); } }
```

7.3 Formatting

Faster `cin` and `cout`.

```

1 std::ios::sync_with_stdio (0);
2 std::cin.tie (0); std::cout.tie (0);
```

Examples on IO functions.

```

1 std::string str;
2 std::getline (std::cin, str, '#');
3 char ch[100];
4 std::cin.getline (ch, 100, '#');
5 fgets (ch, 100, stdin);
6 int c = std::cin.peek ();
7 std::cin.ignore (100, '#');
8 std::cin.ignore (100, EOF);
9 std::cin.seekg (0, std::cin.end);
10 int length = std::cin.tellg ();
11 std::cin.seekg (0, std::cin.beg);
12 char *buf = new char[length];
13 std::cin.read (buf, length);
14 std::cout << std::setw (10);
15 std::cout << std::setfill ('#');
16 std::cout << std::left << x << "\n";
17 std::cout << std::internal << x << "\n";
18 std::cout << std::right << x << "\n";
19 std::cout << std::setprecision (10);
20 std::cout << std::fixed; // std::cout << std::
    scientific;
```

7.4 Java

Import Libraries that are commonly used.

```

1 import java.io.*;
2 import java.lang.*;
3 import java.math.*;
4 import java.util.*;
```

Input `Scanner` is generally used to handle input.

```
1 Scanner in = new Scanner (System.in);
```

Or:

```
1 Scanner in = new Scanner (new BufferedInputStream (
    System.in));
```

Usage: `next + <typename> ()`, `hasNext + <typename> ()`.
e.g. `in.nextInt ()`, `in.nextBigInteger ()`, `in.nextLine ()`, `in.hasNextInt ()`, etc.

Output Use `System.out` for output.

```

1 System.out.print (/*...*/);
2 System.out.println (/*...*/);
3 System.out.printf (/*...*/);
```

BigInteger To convert to a `BigInteger`, use `BigInteger.valueOf (int)` or `BigInteger (String, radix)`.

To convert from a `BigInteger`, use `.intValue ()`, `.longValue ()`, `.toString (radix)`.

Common unary operations include `.abs ()`, `.negate ()`, `.not ()`.

Common binary operations include `.max`, `.min`, `.add`, `.subtract`, `.multiply`, `.divide`, `.remainder`, `.gcd`, `.modInverse`, `.and`, `.or`, `.xor`, `.shiftLeft (int)`, `.shiftRight (int)`, `.pow (int)`, `.compareTo`.

Divide and remainder: `BigInteger[] .divideAndRemainder (BigInteger val)`.

Power module: `.modPow (BigInteger exponent, module)`.

Primality check: `.isProbablePrime (int certainty)`.

BigDecimal Literally a `BigInteger` and a scale.

When rounding, it is necessary to specify a `RoundingMode`, namely `BigDecimal.<mode>`, which includes:

`CEILING`, `DOWN`, `FLOOR`, `HALF_DOWN`, `HALF_EVEN`, `HALF_UP`, `UNNECESSARY`, `UP`.

To convert to a `BigDecimal`, use `BigDecimal.valueOf (...)`, `BigDecimal (BigInteger, scale)` or `BigDecimal (String)`.

To divide: `.divide (BigDecimal, scale, roundingmode)`.

To set the scale: `.setScale (scale, roundingmode)`.

To remove trailing zeroes: `.stripTrailingZeros ()`.

Array Sort: `Arrays.sort (T[] a)`;

`Arrays.sort (T[] a, int fromIndex, int toIndex)`;

`Arrays.sort (T[] a, int fromIndex, int toIndex, Comparator <? super T> comparator)`;

PriorityQueue An implementation of a min-heap.

Add element: `add (E)`.

Retrieve and pop element: `poll ()`.

Retrieve element: `peek ()`.

Size: `size ()`.

Clear: `clear ()`.

Comparator: `PriorityQueue <E> (int initcap, Comparator <? super E> comparator)`

TreeMap An implementation of a map. The entry is named `Map.Entry <K, V>`.

Retrieve key and value from an entry: `getKey`, `getValue ()`, `setValue (V)`.

Retrieve entry: `ceilingEntry`, `floorEntry`, `higherEntry`, `lowerEntry`.

Simplified operations: `clear ()`, `put (K, V)`, `get (K)`, `remove (K)`, `size ()`.

Comparator: `TreeMap <K, V> (Comparator <? super K> comparator)`.

StringBuilder Construction: `StringBuilder (String)`.

Insertion: `append (...)`, `insert (offset, ...)`. ... can be almost every type!

Fetch: `charAt (int)`.

Modification: `setCharAt (int, char)`, `delete (int, int)`, `reverse ()`.

Output: `length ()`, `toString ()`.

String Formatting: `String.format (String, ...)`.

Case transform: `toLowerCase`, `toUpperCase`.

Comparator An example on a comparator.

```

1 public class Main {
2     public class Point {
3         public int x; public int y;
4         public Point () {
5             x = 0;
6             y = 0; }
7         public Point (int xx, int yy) {
8             x = xx;
9             y = yy; } }
10    public class Cmp implements Comparator <Point> {
11        public int compare (Point a, Point b) {
12            if (a.x < b.x) return -1;
13            if (a.x == b.x) {
14                if (a.y < b.y) return -1;
15                if (a.y == b.y) return 0; }
16            return 1; } }
17    public static void main (String [] args) {
18        Cmp c = new Cmp ();
19        TreeMap <Point, Point> t = new TreeMap <Point, Point>
20            > (c);
21        return; } }
```

Comparable An example to implement Comparable.

```

1 public class Point implements Comparable <Point> {
2     public int x; public int y;
3     public Point () {
4         x = 0;
5         y = 0; }
6     public Point (int xx, int yy) {
7         x = xx;
8         y = yy; }
9     public int compareTo (Point p) {
10        if (x < p.x) return -1;
11        if (x == p.x) {
12            if (y < p.y) return -1;
13            if (y == p.y) return 0; }
14        return 1; }
15    public boolean equalTo (Point p) {
16        return (x == p.x && y == p.y); }
17    public int hashCode () {
18        return x + y; } }

```

Fast IO A class for faster IO.

```

1 public class Main {
2     static class InputReader {
3         public BufferedReader reader;
4         public StringTokenizer tokenizer;
5         public InputReader (InputStream stream) {
6             reader = new BufferedReader (new InputStreamReader
7                 (stream), 32768);
8             tokenizer = null; }
9         public String next() {
10            while (tokenizer == null || !tokenizer.
11                hasMoreTokens()) {
12                try {
13                    String line = reader.readLine();
14                    tokenizer = new StringTokenizer (line);
15                } catch (IOException e) {
16                    throw new RuntimeException (e); } }
17            return tokenizer.nextToken(); }
18        public BigInteger nextBigInteger() {
19            return new BigInteger (next (), 10); /* radix */
20        public int nextInt() {
21            return Integer.parseInt (next()); }
22        public double nextDouble() {
23            return Double.parseDouble (next()); } }
24    public static void main (String[] args) {
25        InputReader in = new InputReader (System.in);
26    } }

```

7.5 Random numbers

An example on the usage of generator and distribution.

```

1 std::mt19937_64 mt (time (0));
2 std::uniform_int_distribution <int> uid (1, 100);
3 std::uniform_real_distribution <double> urd (1, 100);
4 std::cout << uid (mt) << " " << urd (mt) << "\n";

```

7.6 Regular expression

This is an example to construct a pattern:

```

1 std::string str = ("The_the_there");
2 std::regex pattern ("(th|Th)[\\w]*", std::
3     regex_constants::optimize | std::regex_constants::
4     ECMAScript);
5 std::smatch match; //std::cmatch for char *

```

Use `std::regex_match` to find exact matches:

```

1 std::regex_match (str, match, pattern);

```

Use `std::sregex_iterator` to search for patterns:

```

1 auto mbegin = std::sregex_iterator (str.begin (), str.
2     end (), pattern);
3 auto mend = std::sregex_iterator ();
4 std::cout << "Found " << std::distance (mbegin, mend)
5     << "\n";
6 for (std::sregex_iterator i = mbegin; i != mend; ++i)
7     match = *i; /*...*/ }

```

The whole match is in `match[0]`, and backreferences are in `match[i]` up to `match.size ()`. `match.prefix ()` and `match.suffix ()` give the prefix and the suffix. `match.length ()` gives length and `match.position ()` gives the position of the match.

To replace a certain regular expression with another one, use `std::regex_replace`.

```

1 std::regex_replace (str, pattern, "sh");

```

where `$n` is the backreference, `$&` is the entire match, `$'` is the prefix, `$'` is the suffix, `$$` is the `$` sign.

7.7 Stack hack

The following lines allow the program to use larger stack memory.

```

1 //C++
2 #pragma comment (linker, "/STACK:36777216")
3 //G++
4 int __size__ = 256 << 20;
5 char *_p = (char*) malloc (__size__ + __size__);
6 __asm__ ("movl %0, %%esp\n" :: "r" (__p));

```

7.8 Time hack

The following lines allow the program to check current time.

```

1 clock_t t = clock ();
2 std::cout << 1. * t / CLOCKS_PER_SEC << "\n";

```

8 Appendix**8.1 Table of formulae****Binomial Coefficients**

$$\binom{n}{k} = (-1)^k \binom{k-n-1}{k}, \quad \sum_{k \leq n} \binom{r+k}{k} = \binom{r+n+1}{n}$$

$$\sum_{k=0}^n \binom{k}{m} = \binom{n+1}{m+1}$$

$$\sqrt{1+z} = 1 + \sum_{k=1}^{\infty} \frac{(-1)^{k-1}}{k \times 2^{k-1}} \binom{2k-2}{k-1} z^k$$

$$\sum_{k=0}^r \binom{r-k}{m} \binom{s+k}{n} = \binom{r+s+1}{m+n+1}$$

$$C_{n,m} = \binom{n+m}{m} - \binom{n+m}{m-1}, n \geq m$$

$$\binom{n}{k} \equiv [n \& k = k] \pmod{2}$$

$$\binom{n_1 + \dots + n_p}{m} = \sum_{k_1 + \dots + k_p = m} \binom{n_1}{k_1} \dots \binom{n_p}{k_p}$$

Fibonacci Numbers

$$F(z) = \frac{z}{1-z-z^2}$$

$$f_n = \frac{\phi^n - \hat{\phi}^n}{\sqrt{5}}, \phi = \frac{1+\sqrt{5}}{2}, \hat{\phi} = \frac{1-\sqrt{5}}{2}$$

$$\sum_{k=1}^n f_k = f_{n+2} - 1, \quad \sum_{k=1}^n f_k^2 = f_n f_{n+1}$$

$$\sum_{k=0}^n f_k f_{n-k} = \frac{1}{5} (n-1) f_n + \frac{2}{5} n f_{n-1}$$

$$\frac{f_{2n}}{f_n} = f_{n-1} + f_{n+1}$$

$$f_1 + 2f_2 + 3f_3 + \dots + n f_n = n f_{n+2} - f_{n+3} + 2$$

$$\gcd(f_m, f_n) = f_{\gcd(m,n)}$$

$$f_n^2 + (-1)^n = f_{n+1} f_{n-1}$$

$$f_{n+k} = f_n f_{k+1} + f_{n-1} f_k$$

$$f_{2n+1} = f_n^2 + f_{n+1}^2$$

$$(-1)^k f_{n-k} = f_n f_{k-1} - f_{n-1} f_k$$

$$\text{Modulo } f_n, f_{mn+r} \equiv \begin{cases} f_r, & m \bmod 4 = 0; \\ (-1)^{r+1} f_{n-r}, & m \bmod 4 = 1; \\ (-1)^n f_r, & m \bmod 4 = 2; \\ (-1)^{r+1+n} f_{n-r}, & m \bmod 4 = 3. \end{cases}$$

Period modulo a prime p is a factor of $2p+2$ or $p-1$.

Only exception: $G(5) = 20$.

Period modulo the power of a prime p^k : $G(p^k) = G(p)p^{k-1}$.

Period modulo $n = p_1^{k_1} \dots p_m^{k_m}$: $G(n) = \text{lcm}(G(p_1^{k_1}), \dots, G(p_m^{k_m}))$.

Lucas Numbers

$$L_0 = 2, L_1 = 1, L_n = L_{n-1} + L_{n-2} = \left(\frac{1+\sqrt{5}}{2}\right)^n + \left(\frac{1-\sqrt{5}}{2}\right)^n$$

$$L(x) = \frac{2-x}{1-x-x^2}$$

Catlan Numbers

$$c_1 = 1, c_n = \sum_{i=0}^{n-1} c_i c_{n-1-i} = c_{n-1} \frac{4n-2}{n+1} = \frac{\binom{2n}{n}}{n+1}$$

$$= \binom{2n}{n} - \binom{2n}{n-1}, c(x) = \frac{1-\sqrt{1-4x}}{2x}$$

Stirling Cycle Numbers Divide n elements into k non-empty cycles.

$$s(n, 0) = 0, s(n, n) = 1, s(n+1, k) = s(n, k-1) - ns(n, k)$$

$$s(n, k) = (-1)^{n-k} \begin{bmatrix} n \\ k \end{bmatrix}$$

$$\begin{bmatrix} n+1 \\ k \end{bmatrix} = n \begin{bmatrix} n \\ k \end{bmatrix} + \begin{bmatrix} n \\ k-1 \end{bmatrix}, \begin{bmatrix} n+1 \\ 2 \end{bmatrix} = n! H_n$$

$$x^n = x(x-1)\dots(x-n+1) = \sum_{k=0}^n \begin{bmatrix} n \\ k \end{bmatrix} (-1)^{n-k} x^k$$

$$x^{\overline{n}} = x(x+1)\dots(x+n-1) = \sum_{k=0}^n \begin{bmatrix} n \\ k \end{bmatrix} x^k$$

Stirling Subset Numbers Divide n elements into k non-empty subsets.

$$\begin{Bmatrix} n+1 \\ k \end{Bmatrix} = k \begin{Bmatrix} n \\ k \end{Bmatrix} + \begin{Bmatrix} n \\ k-1 \end{Bmatrix}$$

$$x^n = \sum_{k=0}^n \begin{Bmatrix} n \\ k \end{Bmatrix} x^{\overline{k}} = \sum_{k=0}^n \begin{Bmatrix} n \\ k \end{Bmatrix} (-1)^{n-k} x^{\overline{k}}$$

$$m! \begin{Bmatrix} n \\ m \end{Bmatrix} = \sum_{k=0}^m \binom{m}{k} k^n (-1)^{m-k}$$

$$\sum_{k=1}^n k^p = \sum_{k=0}^p \begin{Bmatrix} p \\ k \end{Bmatrix} (n+1)^k$$

For a fixed k , generating functions :

$$\sum_{n=0}^{\infty} \begin{Bmatrix} n \\ k \end{Bmatrix} x^{n-k} = \prod_{r=1}^k \frac{1}{1-rx}$$

Motzkin Numbers Draw non-intersecting chords between n points on a circle.

Pick n numbers $k_1, k_2, \dots, k_n \in \{-1, 0, 1\}$ so that $\sum_{i=1}^n k_i (1 \leq i \leq n)$ is non-negative and the sum of all numbers is 0.

$$M_{n+1} = M_n + \sum_i M_i M_{n-1-i} = \frac{(2n+3)M_n + 3nM_{n-1}}{n+3}$$

$$M_n = \sum_{i=0}^{\lfloor \frac{n}{2} \rfloor} \binom{n}{2k} \text{Catlan}(k)$$

$$M(X) = \frac{1-x-\sqrt{1-2x-3x^2}}{2x^2}$$

Eulerian Numbers Permutations of the numbers 1 to n in which exactly k elements are greater than the previous element.

$$\langle n \rangle_k = (k+1) \langle n-1 \rangle_k + (n-k) \langle n-1 \rangle_{k-1}$$

$$x^n = \sum_k \langle n \rangle_k \binom{x+k}{n}$$

$$\langle n \rangle_m = \sum_{k=0}^m \binom{n+1}{k} (m+1-k)^n (-1)^k$$

Harmonic Numbers Sum of the reciprocals of the first n natural numbers.

$$\sum_{k=1}^n H_k = (n+1)H_n - n$$

$$\sum_{k=1}^n kH_k = \frac{n(n+1)}{2} H_n - \frac{n(n-1)}{4}$$

$$\sum_{k=1}^n \binom{k}{m} H_k = \binom{n+1}{m+1} \left(H_{n+1} - \frac{1}{m+1} \right)$$

Pentagonal Number Theorem

$$\prod_{n=1}^{\infty} (1-x^n) = \sum_{n=-\infty}^{\infty} (-1)^k x^{k(3k-1)/2}$$

$$p(n) = p(n-1) + p(n-2) - p(n-5) - p(n-7) + \dots$$

$$f(n, k) = p(n) - p(n-k) - p(n-2k) + p(n-5k) + p(n-7k) - \dots$$

Bell Numbers Divide a set that has exactly n elements.

$$B_n = \sum_{k=1}^n \begin{Bmatrix} n \\ k \end{Bmatrix}, \quad B_{n+1} = \sum_{k=0}^n \binom{n}{k} B_k$$

$$B_{p^m+n} \equiv mB_n + B_{n+1} \pmod{p}$$

$$B(x) = \sum_{n=0}^{\infty} \frac{B_n}{n!} x^n = e^{e^x-1}$$

Bernoulli Numbers

$$B_n = 1 - \sum_{k=0}^{n-1} \binom{n}{k} \frac{B_k}{n-k+1}$$

$$G(x) = \sum_{k=0}^{\infty} \frac{B_k}{k!} x^k = \frac{1}{\sum_{k=0}^{\infty} \frac{x^k}{(k+1)!}}$$

$$\sum_{k=1}^n k^m = \frac{1}{m+1} \sum_{k=0}^m \binom{m+1}{k} B_k n^{m-k+1}$$

Sum of Powers

$$\sum_{i=1}^n i^2 = \frac{n(n+1)(2n+1)}{6}, \quad \sum_{i=1}^n i^3 = \left(\frac{n(n+1)}{2} \right)^2$$

$$\sum_{i=1}^n i^4 = \frac{n(n+1)(2n+1)(3n^2+3n-1)}{30}$$

$$\sum_{i=1}^n i^5 = \frac{n^2(n+1)^2(2n^2+2n-1)}{12}$$

Sum of Squares Denote $r_k(n)$ the ways to form n with k squares. If :

$$n = 2^{a_0} p_1^{2a_1} \dots p_r^{2a_r} q_1 b_1 \dots q_s b_s$$

where $p_i \equiv 3 \pmod{4}$, $q_i \equiv 1 \pmod{4}$, then

$$r_2(n) = \begin{cases} 0 & \text{if any } a_i \text{ is a half-integer} \\ 4 \prod_{i=1}^r (b_i + 1) & \text{if all } a_i \text{ are integers} \end{cases}$$

$r_3(n) > 0$ when and only when n is not $4^a(8b+7)$.

Derangement

$$D_1 = 0, D_2 = 1, D_n = n! \left(\frac{1}{0!} - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \dots + \frac{(-1)^n}{n!} \right)$$

$$D_n = (n-1)(D_{n-1} + D_{n-2})$$

Tetrahedron Volume If U, V, W, u, v, w are lengths of edges of the tetrahedron (first three form a triangle; u opposite to U and so on)

$$V = \frac{\sqrt{4u^2v^2w^2 - \sum_{cyc} u^2(v^2+w^2-U^2)^2 + \prod_{cyc} (v^2+w^2-U^2)}}{12}$$

8.2 Table of integrals

$$\begin{aligned} \left(\frac{u}{v}\right)' &= \frac{u'v-uv'}{v^2} & (\operatorname{arcsec} x)' &= \frac{1}{x\sqrt{1-x^2}} \\ (a^x)' &= (\ln a)a^x & (\tanh x)' &= \operatorname{sech}^2 x \\ (\tan x)' &= \sec^2 x & (\coth x)' &= -\operatorname{csch}^2 x \\ (\cot x)' &= -\csc^2 x & (\operatorname{sech} x)' &= -\operatorname{sech} x \tanh x \\ (\sec x)' &= \tan x \sec x & (\operatorname{csch} x)' &= -\operatorname{csch} x \coth x \\ (\csc x)' &= -\cot x \csc x & (\operatorname{arcsinh} x)' &= \frac{1}{\sqrt{1+x^2}} \\ (\arcsin x)' &= \frac{1}{\sqrt{1-x^2}} & (\operatorname{arccosh} x)' &= \frac{1}{\sqrt{x^2-1}} \\ (\arccos x)' &= -\frac{1}{\sqrt{1-x^2}} & (\operatorname{arctanh} x)' &= \frac{1}{1-x^2} \\ (\arctan x)' &= \frac{1}{1+x^2} & (\operatorname{arccoth} x)' &= \frac{1}{x^2-1} \\ (\operatorname{arccot} x)' &= -\frac{1}{1+x^2} & (\operatorname{arccsch} x)' &= -\frac{1}{|x|\sqrt{1+x^2}} \\ (\operatorname{arccsc} x)' &= -\frac{1}{x\sqrt{1-x^2}} & (\operatorname{arcsech} x)' &= -\frac{1}{x\sqrt{1-x^2}} \end{aligned}$$

$ax+b$ ($a \neq 0$)

$$\begin{aligned} 1. \int \frac{x}{ax+b} dx &= \frac{1}{a^2} (ax+b-b \ln |ax+b|) + C \\ 2. \int \frac{x^2}{ax+b} dx &= \frac{1}{a^3} \left(\frac{1}{2} (ax+b)^2 - 2b(ax+b) + b^2 \ln |ax+b| \right) + C \\ 3. \int \frac{dx}{x(ax+b)} &= -\frac{1}{b} \ln \left| \frac{ax+b}{x} \right| + C \\ 4. \int \frac{dx}{x^2(ax+b)} &= -\frac{1}{bx} + \frac{a}{b^2} \ln \left| \frac{ax+b}{x} \right| + C \\ 5. \int \frac{x}{(ax+b)^2} dx &= \frac{1}{a^2} \left(\ln |ax+b| + \frac{b}{ax+b} \right) + C \\ 6. \int \frac{x^2}{(ax+b)^2} dx &= \frac{1}{a^3} \left(ax+b-2b \ln |ax+b| - \frac{b^2}{ax+b} \right) + C \\ 7. \int \frac{dx}{x(ax+b)^2} &= \frac{1}{b(ax+b)} - \frac{1}{b^2} \ln \left| \frac{ax+b}{x} \right| + C \end{aligned}$$

$\sqrt{ax+b}$

$$\begin{aligned} 1. \int \sqrt{ax+b} dx &= \frac{2}{3a} \sqrt{(ax+b)^3} + C \\ 2. \int x \sqrt{ax+b} dx &= \frac{2}{15a^2} (3ax-2b) \sqrt{(ax+b)^3} + C \\ 3. \int x^2 \sqrt{ax+b} dx &= \frac{2}{105a^3} (15a^2x^2-12abx+8b^2) \sqrt{(ax+b)^3} + C \\ 4. \int \frac{x}{\sqrt{ax+b}} dx &= \frac{2}{3a^2} (ax-2b) \sqrt{ax+b} + C \\ 5. \int \frac{x^2}{\sqrt{ax+b}} dx &= \frac{2}{15a^3} (3a^2x^2-4abx+8b^2) \sqrt{ax+b} + C \\ 6. \int \frac{dx}{x \sqrt{ax+b}} &= \begin{cases} \frac{1}{\sqrt{b}} \ln \left| \frac{\sqrt{ax+b}-\sqrt{b}}{\sqrt{ax+b}+\sqrt{b}} \right| + C & (b > 0) \\ \frac{2}{\sqrt{-b}} \arctan \sqrt{\frac{ax+b}{-b}} + C & (b < 0) \end{cases} \\ 7. \int \frac{dx}{x^2 \sqrt{ax+b}} &= -\frac{\sqrt{ax+b}}{bx} - \frac{a}{2b} \int \frac{dx}{x \sqrt{ax+b}} \\ 8. \int \frac{\sqrt{ax+b}}{x} dx &= 2\sqrt{ax+b} + b \int \frac{dx}{x \sqrt{ax+b}} \\ 9. \int \frac{\sqrt{ax+b}}{x^2} dx &= -\frac{\sqrt{ax+b}}{x} + \frac{a}{2} \int \frac{dx}{x \sqrt{ax+b}} \end{aligned}$$

6. $\int \frac{x}{\sqrt{c+bx-ax^2}} dx = -\frac{1}{a} \sqrt{c + bx - ax^2} + \frac{b}{2\sqrt{a^3}} \arcsin \frac{2ax-b}{\sqrt{b^2+4ac}} + C$

$$\sqrt{\pm \frac{x-a}{x-b}} \quad \& \quad \sqrt{(x-a)(x-b)}$$

1. $\int \sqrt{\frac{x-a}{x-b}} dx = (x-b) \sqrt{\frac{x-a}{x-b}} + (b-a) \ln(\sqrt{|x-a|} + \sqrt{|x-b|}) + C$
2. $\int \sqrt{\frac{x-a}{b-x}} dx = (x-b) \sqrt{\frac{x-a}{b-x}} + (b-a) \arcsin \sqrt{\frac{x-a}{b-x}} + C$
3. $\int \frac{dx}{\sqrt{(x-a)(b-x)}} = 2 \arcsin \sqrt{\frac{x-a}{b-a}} + C \quad (a < b)$
4. $\int \sqrt{(x-a)(b-x)} dx = \frac{2x-a-b}{4} \sqrt{(x-a)(b-x)} + \frac{(b-a)^2}{4} \arcsin \sqrt{\frac{x-a}{b-a}} + C \quad (a < b)$

Triangular function

1. $\int \tan x dx = -\ln |\cos x| + C$
2. $\int \cot x dx = \ln |\sin x| + C$
3. $\int \sec x dx = \ln \left| \tan \left(\frac{x}{2} + \frac{\pi}{2} \right) \right| + C = \ln |\sec x + \tan x| + C$
4. $\int \csc x dx = \ln \left| \tan \frac{x}{2} \right| + C = \ln |\csc x - \cot x| + C$
5. $\int \sec^2 x dx = \tan x + C$
6. $\int \csc^2 x dx = -\cot x + C$
7. $\int \sec x \tan x dx = \sec x + C$
8. $\int \csc x \cot x dx = -\csc x + C$
9. $\int \sin^2 x dx = \frac{x}{2} - \frac{1}{4} \sin 2x + C$
10. $\int \cos^2 x dx = \frac{x}{2} + \frac{1}{4} \sin 2x + C$
11. $\int \sin^n x dx = -\frac{1}{n} \sin^{n-1} x \cos x + \frac{n-1}{n} \int \sin^{n-2} x dx$
12. $\int \cos^n x dx = \frac{1}{n} \cos^{n-1} x \sin x + \frac{n-1}{n} \int \cos^{n-2} x dx$
13. $\frac{dx}{\sin^n x} = -\frac{1}{n-1} \frac{\cos x}{\sin^{n-1} x} + \frac{n-2}{n-1} \int \frac{dx}{\sin^{n-2} x}$
14. $\frac{dx}{\cos^n x} = \frac{1}{n-1} \frac{\sin x}{\cos^{n-1} x} + \frac{n-2}{n-1} \int \frac{dx}{\cos^{n-2} x}$
- 15.

$$\begin{aligned} & \int \cos^m x \sin^n x dx \\ &= \frac{1}{m+n} \cos^{m-1} x \sin^{n+1} x + \frac{m-1}{m+n} \int \cos^{m-2} x \sin^n x dx \\ &= -\frac{1}{m+n} \cos^{m+1} x \sin^{n-1} x + \frac{n-1}{m+1} \int \cos^m x \sin^{n-2} x dx \end{aligned}$$

16. $\int \sin ax \cos bx dx = -\frac{1}{2(a+b)} \cos(a+b)x - \frac{1}{2(a-b)} \cos(a-b)x + C$
17. $\int \sin ax \sin bx dx = -\frac{1}{2(a+b)} \sin(a+b)x + \frac{1}{2(a-b)} \sin(a-b)x + C$
18. $\int \cos ax \cos bx dx = \frac{1}{2(a+b)} \sin(a+b)x + \frac{1}{2(a-b)} \sin(a-b)x + C$

19. $\int \frac{dx}{a+bx \sin x} = \begin{cases} \frac{2}{\sqrt{a^2-b^2}} \arctan \frac{a \tan \frac{x}{2} + b}{\sqrt{a^2-b^2}} + C & (a^2 > b^2) \\ \frac{1}{\sqrt{b^2-a^2}} \ln \left| \frac{a \tan \frac{x}{2} + b - \sqrt{b^2-a^2}}{a \tan \frac{x}{2} + b + \sqrt{b^2-a^2}} \right| + C & (a^2 < b^2) \end{cases}$
20. $\int \frac{dx}{a+bx \cos x} = \begin{cases} \frac{2}{a+b} \sqrt{\frac{a+b}{a-b}} \arctan \left(\sqrt{\frac{a-b}{a+b}} \tan \frac{x}{2} \right) + C & (a^2 > b^2) \\ \frac{1}{a+b} \sqrt{\frac{a+b}{a-b}} \ln \left| \frac{\tan \frac{x}{2} + \sqrt{\frac{a+b}{a-b}}}{\tan \frac{x}{2} - \sqrt{\frac{a+b}{a-b}}} \right| + C & (a^2 < b^2) \end{cases}$

21. $\int \frac{dx}{a^2 \cos^2 x + b^2 \sin^2 x} = \frac{1}{ab} \arctan \left(\frac{b}{a} \tan x \right) + C$
22. $\int \frac{dx}{a^2 \cos^2 x - b^2 \sin^2 x} = \frac{1}{2ab} \ln \left| \frac{b \tan x + a}{b \tan x - a} \right| + C$
23. $\int x \sin ax dx = \frac{1}{a^2} \sin ax - \frac{1}{a} x \cos ax + C$
24. $\int x^2 \sin ax dx = -\frac{1}{a^2} x^2 \cos ax + \frac{2}{a^2} x \sin ax + \frac{2}{a^3} \cos ax + C$
25. $\int x \cos ax dx = \frac{1}{a^2} \cos ax + \frac{1}{a} x \sin ax + C$
26. $\int x^2 \cos ax dx = \frac{1}{a^2} x^2 \sin ax + \frac{2}{a^2} x \cos ax - \frac{2}{a^3} \sin ax + C$

Inverse triangular function $(a > 0)$

1. $\int \arcsin \frac{x}{a} dx = x \arcsin \frac{x}{a} + \sqrt{a^2 - x^2} + C$
2. $\int x \arcsin \frac{x}{a} dx = \left(\frac{x^2}{2} - \frac{a^2}{4} \right) \arcsin \frac{x}{a} + \frac{x}{4} \sqrt{x^2 - a^2} + C$
3. $\int x^2 \arcsin \frac{x}{a} dx = \frac{x^3}{3} \arcsin \frac{x}{a} + \frac{1}{9} (x^2 + 2a^2) \sqrt{a^2 - x^2} + C$
4. $\int \arccos \frac{x}{a} dx = x \arccos \frac{x}{a} - \sqrt{a^2 - x^2} + C$
5. $\int x \arccos \frac{x}{a} dx = \left(\frac{x^2}{2} - \frac{a^2}{4} \right) \arccos \frac{x}{a} - \frac{x}{4} \sqrt{a^2 - x^2} + C$
6. $\int x^2 \arccos \frac{x}{a} dx = \frac{x^3}{3} \arccos \frac{x}{a} - \frac{1}{9} (x^2 + 2a^2) \sqrt{a^2 - x^2} + C$
7. $\int \arctan \frac{x}{a} dx = x \arctan \frac{x}{a} - \frac{a}{2} \ln(a^2 + x^2) + C$
8. $\int x \arctan \frac{x}{a} dx = \frac{1}{2} (a^2 + x^2) \arctan \frac{x}{a} - \frac{a}{2} x + C$
9. $\int x^2 \arctan \frac{x}{a} dx = \frac{x^3}{3} \arctan \frac{x}{a} - \frac{a}{6} x^2 + \frac{a^3}{6} \ln(a^2 + x^2) + C$

Exponential function

1. $\int a^x dx = \frac{1}{\ln a} a^x + C$
2. $\int e^{ax} dx = \frac{1}{a} a^{ax} + C$
3. $\int x e^{ax} dx = \frac{1}{a^2} (ax - 1) a^{ax} + C$

4. $\int x^n e^{ax} dx = \frac{1}{a} x^n e^{ax} - \frac{n}{a} \int x^{n-1} e^{ax} dx$
5. $\int x a^x dx = \frac{x}{\ln a} a^x - \frac{1}{(\ln a)^2} a^x + C$
6. $\int x^n a^x dx = \frac{1}{\ln a} x^n a^x - \frac{n}{\ln a} \int x^{n-1} a^x dx$
7. $\int e^{ax} \sin bxdx = \frac{1}{a^2 + b^2} e^{ax} (a \sin bx - b \cos bx) + C$
8. $\int e^{ax} \cos bxdx = \frac{1}{a^2 + b^2} e^{ax} (b \sin bx + a \cos bx) + C$
9. $\int e^{ax} \sin^n bxdx = \frac{1}{a^2 + b^2 n^2} e^{ax} \sin^{n-1} bx (a \sin bx - nb \cos bx) + \frac{n(n-1)b^2}{a^2 + b^2 n^2} \int e^{ax} \sin^{n-2} bxdx$
10. $\int e^{ax} \cos^n bxdx = \frac{1}{a^2 + b^2 n^2} e^{ax} \cos^{n-1} bx (a \cos bx + nb \sin bx) + \frac{n(n-1)b^2}{a^2 + b^2 n^2} \int e^{ax} \cos^{n-2} bxdx$

Logarithmic function

1. $\int \ln x dx = x \ln x - x + C$
2. $\int \frac{dx}{x \ln x} = \ln |\ln x| + C$
3. $\int x^n \ln x dx = \frac{1}{n+1} x^{n+1} (\ln x - \frac{1}{n+1}) + C$
4. $\int (\ln x)^n dx = x (\ln x)^n - n \int (\ln x)^{n-1} dx$
5. $\int x^m (\ln x)^n dx = \frac{1}{m+1} x^{m+1} (\ln x)^n - \frac{n}{m+1} \int x^m (\ln x)^{n-1} dx$

8.3 Table of regular expression

8.3.1 Special pattern characters

Characters	Description
.	Not newline
\t	Tab (HT)
\n	Newline (LF)
\v	Vertical tab (VT)
\f	Form feed (FF)
\r	Carriage return (CR)
\cletter	Control code
\xhh	ASCII character
\uhhhh	Unicode character
\0	Null
\int	Backreference
\d	Digit
\D	Not digit
\s	Whitespace
\S	Not whitespace
\w	Word (letters, numbers and the underscore)
\W	Not word
\character	Character
[class]	Character class
[^class]	Negated character class

8.3.2 Quantifiers

Characters	Times
*	0 or more
+	1 or more
?	0 or 1
{int}	int
{int,}	int or more
{min,max}	Between min and max

By default, all these quantifiers are greedy (i.e., they take as many characters that meet the condition as possible). This behavior can be overridden to ungreedy (i.e., take as few characters that meet the condition as possible) by adding a question mark (?) after the quantifier.

8.3.3 Groups

Characters	Description
(subpattern)	Group with backreference
(?:subpattern)	Group without backreference

8.3.4 Assertions

Characters	Description
^	Beginning of line
\$	End of line
\b	Word boundary
\B	Not a word boundary
(?=subpattern)	Positive lookahead
(?!subpattern)	Negative lookahead

8.3.5 Alternative

A regular expression can contain multiple alternative patterns simply by separating them with the separator operator (|): The regular expression will match if any of the alternatives match, and as soon as one does.

8.3.6 Character classes

Class	Description
[[:alnum:]]	Alpha-numerical character
[[:alpha:]]	Alphabetic character
[[:blank:]]	Blank character
[[:cntrl:]]	Control character
[[:digit:]]	Decimal digit character
[[:graph:]]	Character with graphical representation
[[:lower:]]	Lowercase letter
[[:print:]]	Printable character
[[:punct:]]	Punctuation mark character
[[:space:]]	Whitespace character
[[:upper:]]	Uppercase letter
[[:xdigit:]]	Hexadecimal digit character
[[:d:]]	Decimal digit character
[[:w:]]	Word character
[[:s:]]	Whitespace character

Please note that the brackets in the class names are additional to those opening and closing the class definition. For example:

[[:alpha:]] is a character class that matches any alphabetic character.

[abc[:digit:]] is a character class that matches a, b, c, or a digit.

[^[:space:]] is a character class that matches any character except a whitespace.

8.4 Table of operator precedence

Precedence	Operator	Associativity
1	::	Left-to-right
2	a++ a--	
	type() type{}	
3	a()	Right-to-left
	a[]	
	. ->	
	++a --a	
	+a -a	
	!	
	(type)	
	*a	
	&a	
	sizeof	
4	new new[]	Left-to-right
	delete delete[]	
	.* ->*	
	a*b a/b a%b	
	a+b a-b	
	<< >>	
	< <=	
	> >=	
	== !=	
	a&b	
15	a^b	Right-to-left
	a b	
	&&	
	a?b:c	
	throw	
	=	
	+= -= *= /= %=	
	<<= >>=	
	&= ^= =	
16	,	Left-to-right
